

BREWBOX

BETA

BETA

Logs the temperature while you brew.
Reveals the data behind the flavors you craft.

POTENTIAL NEW FEATURES

Already In Development

Live Reporting

Get a bird's eye view of all the key info – live!

Data Visualization

See exactly where the brew went according to plan (and where it didn't). Spot trends, patterns, and get hard numbers so that you can scale up without losing what makes your brews unique.

Cloud

Access your live and historical brew data from anywhere. Automatic backups keep your precious data safe. The cloud's the limit.

Manage & Share Recipes

Have all the info you need to repeat a recipe in one place – ingredients, quantities, and full temperature log. If you want, you can share select recipes and collaborate with brewers around the world.

Notifications & Alarms

Never set an egg timer again. Get notified when you reach the next step in your process or when a dreaded issue occurs. Finally you can steal the time to refill your pint while brewing.

Industrial Features, Craft Scale

Set it up and it goes – full process automation: cleaning, valves, mixing, heaters, and pumps. Plus, pH monitoring. Shiny.

Tailored to Your Setup

Our system is designed to be modular from the ground up. You get exactly – and only – the components you need. System characterization & custom calibration mean hyper accurate data.

Fermentation Control

Your artistry doesn't stop when the heat goes off. But fermenters can be a bit of a black box. Log important data and automate temperature management to improve quality control.
